

Automated Investigation & Hunting Platform

Datasheet

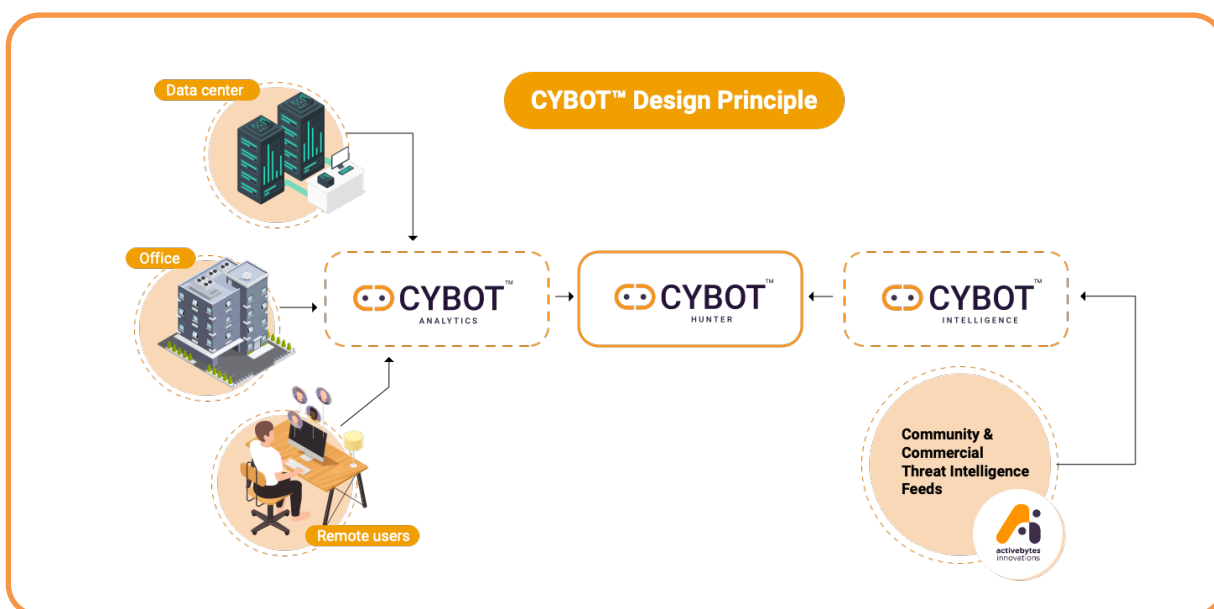

**CYBOT™ Intelligence**

[www.active-bytes.com](http://www.active-bytes.com)

# About CYBOT™

- CYBOT™ collects raw logs from enterprise network, remote users, servers and stores to its analytical engine in a contextualized and secured way. The logs then undergo intelligent automatic analysis, thereby going the extra mile in threat hunting which, a human cannot do.
- CYBOT™ is designed to be adaptive to the latest adversary techniques and tactics by keeping in track with the Threat Intelligence events that it is programmed to receive from our trusted community sources and Activebytes Innovation's dedicated threat intelligence team.
- CYBOT™ intelligently and automatically hunts and investigates the threat leveraging Realtime Logs by performing correlation with TI IOCs received from even the dark sources, thereby detecting adversary attack patterns that a human can never pickup.
- Around the clock monitoring of logs and every unusual, suspected event is subjected to drill down the level of investigation and CYBOT™ is designed to provide automated options to respond along with suggestions and alerts to the security team. This will help analysts to deal with the adversaries that already intruded on the network.

## Why CYBOT™ is Your Automated Adaptive Threat Hunting Solution ?

### CYBOT™ Threat Intelligence

CYBOT™ has a Threat Intelligence Platform which continuously gets updated with knowledge of the latest cyber security threats in the industry worldwide. The inputted Information from both commercial and community threat intelligence events, news and vulnerabilities is accessible in the CYBOT™ platform to both technical and non-technical teams in the form of user-friendly dashboards, printouts and emails. This provides analysts and incident responders with effective intelligence. CYBOT™ is designed to avoid repeated investigation on identical observables including IOCs and patterns, thereby reducing false-positives and noise to the analysts. We extend our security specialist's hands for threat intelligence services like domain takedown.

# CYBOT™ Intelligence

CYBOT™ transforms raw feeds from various commercial and community sources into useful intelligence. The value-added analyzed and contextualized intelligence feeds from Activebytes innovations is also inputted to the platform. This effective intelligence gives and an extra edge to the security team about the latest adversary techniques and tactics, sector targeted, threat landscape, etc. that take place in the world. The huge pool of relevant intelligence feeds helps CYBOT™ in early detection of hidden, unknown, and emerging threats and this helps the analysts to quickly defend and secure their environment.

## **CYBOT™ protects your infrastructure from even the darkest corners**

Threat intelligence feeds from various open sources and dark web sources make the CYBOT™ platform adaptive and efficient in detecting threats that escaped your defence system.

## **No malicious executions go undetected with TIP**

With intelligence sharing, the latest technique adversary executions are fed to CYBOT™ and hence can perform faster malicious IP detection, Domain, Hash detection, etc.

## **User friendly technical and non-technical management summary reports generated with option to download and set notifications**

### Some other features include

- Receiving and sharing threat intelligence information in a controlled, contextualized and structured manner benefiting the enterprise.
- Receiving threat intelligence information from various open source, dark web sources and this makes CYBOT™ intelligent and adaptive to the latest attack trends.
- Receives the latest emerging threat intelligence information from commercial sources as well.
- CYBOT™ is Pre-configured to receive threat intelligence data from multiple sources and contextualize the data for effective correlation with observables in the enterprise environment.
- Role-based access control and can be managed in the Settings option in the platform.
- Records all types of IOCs including IP, URLs, text, files, hashes, IDS signatures, etc. and hence even manually undetectable threats don't escape the investigation.
- Allows internal team to collaborate and discuss security and vulnerability intelligence events and this benefits the whole team with knowledge of the latest attacks and the ways to defend from the same.
- Allows the organization to share threat intelligence information with peers effectively.
- No restrictions with the number of users and new users can be easily added by the admin.
- API for all major functionality allows seamless integration with other security solutions.
- Automatically co-relates and marks related to previous incidents for effective tracking.
- Exportable as dashboards and reports with better graphical representations.
- Meant for both technical and not technical resources.
- Commercial threat feeds and services from ActiveBytes Innovations' dedicated threat intelligence team for effective threat information analysis, identification, domain takedown, etc.
- TI Feeds on Malware Information, Threat Intelligence News, Vulnerability and exploits information makes CYBOT™'s resource pool rich with the latest adversary factors.

## Sample Community Threat Intelligence Events

Capable to securely gather, share, store and correlate IoCs of targeted attacks, vulnerability information etc. This makes the automated hunt faster and efficient.

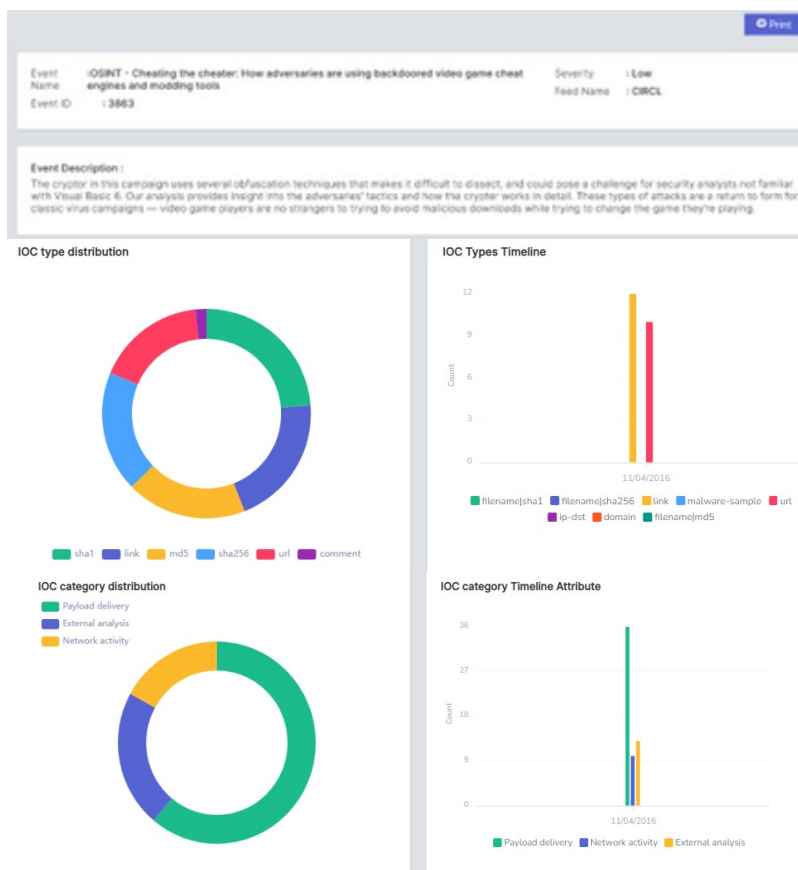

Feeds distribution over time

Attribute category distribution over time

Detailed information on each intelligence event, thereby providing the analysts and the management an insight on emerging threats. This will also help to decide the changes to be made in your present security defence framework. The print button can be used to get the details printed.

Every IOC is listed in indicators table with in-depth information, making the latest events resourceful for analysts

**Expert analysis and comments on security intelligence and vulnerability intelligence are very important for any security team to update their own IT infrastructure security accordingly.**

#### Comments

Whatever you do to find and update vulnerable systems, keep good notes. As we discussed in our livestream on Monday, vulnerabilities like this are often the prompt researchers need to look more closely at related flaws in this library (or other libraries that use similar features).

Yes, you worked your butt off deploying 2.15, and doggone it you have to replace it with 2.16. Note that 2.16 disables all JNDI support by default and removes message lookup handling entirely. These are really excellent steps. JNDI has been fraught with security issues; eliminating that for most of us will be transparent. The good news is you already know where you have Log4j which should simplify deployment and testing. Validate timing and concerns with your vendors to know what update/configuration options are supported.

With the heightened focus on log4j, we expect multiple vulnerabilities to be discovered in the next few months.

**Any vulnerabilities in your environment can lead to a security breach and getting updates about the same for enterprise benefit is an added advantage**

**VULNERABILITIES INTELLIGENCE**

**Vulnerabilities**  
Vulnerabilities are weaknesses in information systems or security infrastructure that could be exploited by a threat source. The following table shows the breakdown of vulnerability information that were obtained from various sources in the given timeframe.

#### Critical Apache Log4j vulnerability being exploited in the wild

Jan 26, 2022, 12:32:26 PM | Severity: **High**

TLP: Not found

#### Vulnerability description:

Defenders across the security community are pushing to address CVE-2021-44228, an actively exploited vulnerability in Apache Log4j. The vulnerability affects a widely used Java logging library that many large organizations may have in their environment. So far, major targets have included Apple and the popular video game 'Minecraft.' This library may also be used as a dependency by a variety of web applications found in enterprise environments, including Elastic. Due to the nature of this vulnerability, Cisco Talos believes this will be a widely exploited vulnerability among attackers moving forward, and users should patch affected products and implement mitigation solutions as soon as possible. Apache has released a new update for Log4j, version 2.16.0. While the previous release (2.15.0) removed the ability to resolve lookups and addressed issues to mitigate CVE-2021-44228, this release disables JNDI by default and removes support for message lookups. Please refer to the Mitigations section for more details.

**Vulnerabilities and exploits are crucial information to security teams since these need to be given extra focus during patch management**

#### Vulnerabilities with exploit

An exploit is a piece of software, data or sequence of commands that takes advantage of a vulnerability to cause unintended behavior or to gain unauthorized access to sensitive data. The following table shows the breakdown of some vulnerabilities with their exploit information including the CVE, CVSS etc. that were obtained from various sources in the given timeframe.

##### Remote code execution vulnerability in Apache Log4j (Log4Shell)

Jan 26, 2022, 11:52:28 AM | Severity: High

TLP: Not found

##### Vulnerability description:

Log4j2 is a ubiquitous library used by millions for Java applications. In Apache Log4j2, attackers can create customized requests to execute remote code. When message lookup replacement is allowed, an attacker with control over log messages or log message parameters can run arbitrary code imported from LDAP servers. All versions of Log4j2 versions >= 2.0-beta9 and <= 2.14.1 are affected by this vulnerability
